1. Assume that a monopolist sells a product with a total cost function $TC = 1{,}200 + 0.5Q^2$. The market demand equation is $Q = 300 - P$.

   (a) What is the inverse market demand equation?

   (b) Please write the monopolist's total revenue as a function of Q. There shouldn't be a P in your final answer.

   (c) What is the monopolist's marginal revenue as a function of Q?

   (d) What is the monopolist's marginal cost?

   (e) What quantity will the monopolist produce, and what price will they charge for their good?
